

## OVERVIEW

Human Operated ransomware  
RansomEXX's Operators  
developed new ELF executable  
to infect Linux based operating  
systems.

## OVERVIEW

- Kaspersky researchers discovered Linux version of windows human operated ransomware RansomEXX's.
- RansomEXX operators created new ELF executable, designed to encrypt data on computers controlled by Linux-based operating systems.
- RansomEXX is known for targeted attacks. Each sample includes hard coded name of victim organization.
- Ransom note also includes name of organization. Encrypted file extension and the email address for contacting the extortionists also make use of the victim organization's name.

Figure 1: RansomEXX RansomNote

## TECHNICAL DETAILS

- Linux version of RansomEXX deploys an ELF executable named 'svc-new' to encrypt a victim's server.
- Ransomware generates a 256-bit key and uses it to encrypt all the files belonging to the victim that it can reach using the AES block cipher in ECB mode.
- The AES key is encrypted by a public RSA-4096 key embedded in the Trojan's body and appended to each encrypted file.
- Ransomware generate regenerate and re-encrypt the AES in every 0.18 seconds.
- Linux and Windows version of ransomware are using some same function of open-source library `mbedtls`.

## INDICATORS OF COMPROMISE

### FILE HASHES (MD5)

Linux: AA1DDF0C8312349BE614FF43E80A262F

Windows: FCD21C6FCA3B9378961AA1865BEE7ECB

## PREVENTIVE AND CORRECTIVE DEFENCE ACTIONS

### Preventive Actions

- Block the IoCs in the corresponding security devices.
- All these IoCs are combined in our Threat Intelligence Feed that is integrated with our SOC to provide proactive threat protection to our clients.
- Employ content scanning and filtering on the organization mail servers. Inbound e-mails should be scanned for known threats and should block any attachment types that could pose a threat.
- Update your Operating system and software to latest version.
- Ensure anti-virus and anti-malware solutions are set to automatically update and regular scans are conducted.
- Do not trust emails from untrusted source.
- Do not open links and attachments from untrusted sources.
- Back-up data, store it outside of network connection.
- Use strong password and change it at regular interval. Don't use the old password again.
- Disable the unwanted services and close the ports that are not needed.

### Corrective Actions

- If infected, disconnect the affected system from the Network.
- Inform the Information Security Team.
- Use antivirus or anti-malware software to clean the malware.
